many Amphoteric & Polyprotic Substances

- * A polyprotic substance will only lose/gain one proton/hydrogen ion at a time
 - Consider the example of carbonic acid. Carbonic acid is <u>diprotic</u>, meaning it has two protons that can be donated

1st ionization:
$$H_2CO_3(a_2) + H_2O_{(e)} = HCO_3(a_2) + H_3O_{(a_2)}^{\dagger}$$

2nd ionization: $HCO_3(a_2) + H_2O_{(e)} = CO_3^2(a_2) + H_3O_{(a_2)}^{\dagger}$

Some organic acids can have several hydrogen atoms in the molecule, but not all
of the hydrogen atoms will be <u>acidic hydrogen ions</u>. <u>Acidic hydrogen ions</u> are
simply the hydrogen ions that can be lost in an acid-base reaction. In an organic
acid, the acidic hydrogen ions are the ones attached in the –COOH group and
are usually found at the ends of the molecule (not the hydrogen atoms contained
in the middle of the molecule).

o Example:

OR

C3H5O(COOH)3 & 3 acidic

• <u>Polyprotic bases</u> usually have a negative charge that is less than -1 and can gain more than one hydrogen ion.

o Example:

Section 17.2 Review Answers

Student Textbook page 690

3.
$$H_3BO_3(aq) + H_2O(\ell) \rightleftharpoons H_3O^+(aq) + H_2BO_3^-(aq)$$

 $H_2BO_3^-(aq) + H_2O(\ell) \rightleftharpoons H_3O^+(aq) + HBO_3^{2-}(aq)$
 $HBO_3^{2-}(aq) + H_2O(\ell) \rightleftharpoons H_3O^+(aq) + BO_3^{3-}(aq)$

Consider the following two reactions:

9ained H⁺

1.
$$NH_{3(g)}$$
 + $H_2O_{(I)}$ \leftrightarrow $NH_4^+(aq)$ + $OH^-(aq)$

base

acid lost H⁺

conjugate base

3. $HCl_{(g)}$ + $H_2O_{(I)}$ \leftrightarrow $H_3O^+(aq)$ + $Cl^-(aq)$

acid lost H⁺

acid lost H⁺

conjugate base

base

 What observations can you make between any similarities and differences?

* • A substance that can act as a base in one reaction and act as an acid in another reaction is called an amphoteric substance or amphiprotic

- Most amphoteric substances are a negatively charged ion that contains at least one <u>acidic hydrogen</u> (ie. HSO_{4 (aq)}, HCO_{3 (aq)}, H₂PO_{4 (aq)})
 - However, not all amphoteric substances fall into this category. An example includes water (H₂O), which can act as an acid and form OH_(aq) or water can act as a base and form H₃O⁺_(aq). Another example is NH₃, which can act as a base and form NH₄⁺ or NH₃ can act as an acid and form NH₂⁻.
 - Check by looking on pg. 8-9 of data book to see if the chemical is found on both sides of the table
